

THE PROBLEM

Building multiple apps?

The traditional approach leads to multiple repositories, **duplicate code**, and more maintenance.

Every new app means a new repo, new setup, and more things to manage.

It doesn't scale well.

ENTER

TURBOREPO

One repo. Multiple apps.
Shared everything.

With Turborepo, you can keep your applications and shared packages in a single, well-organized **monorepo**.

Single Repository

All your apps and packages in one place.

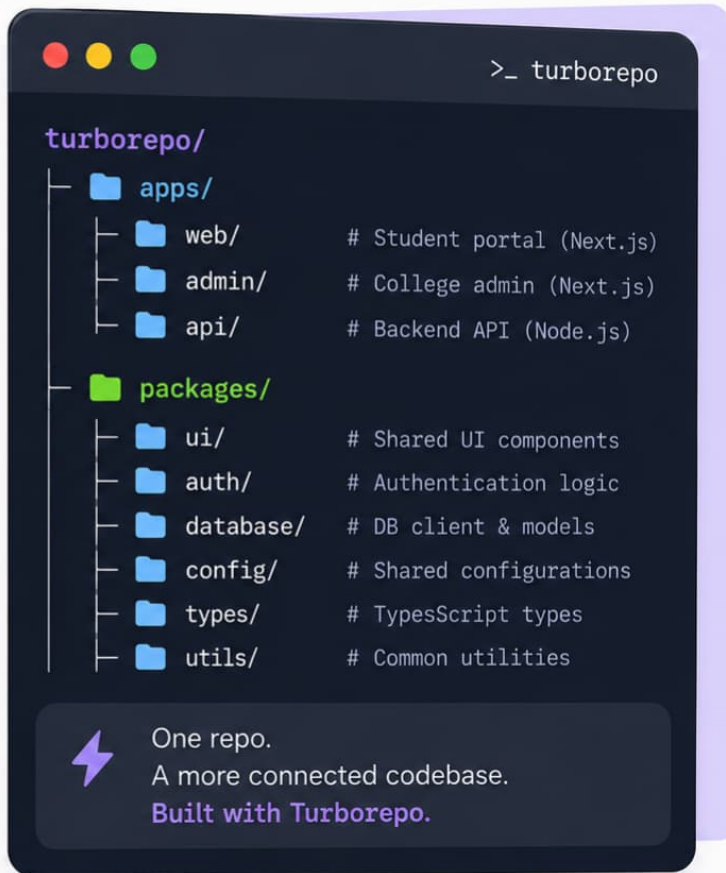

Shared Code

Reuse components, types, configs and more.

Better Collaboration

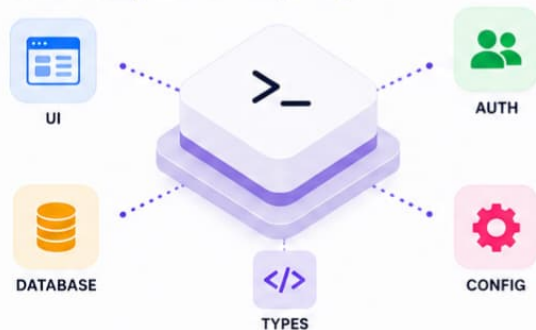

Keep everything versioned together.

WHY IT MATTERS

The real power is **shared infrastructure.**

Turborepo helps you build, share and maintain faster with **consistency** across everything.

Shared UI Components

Build once and use across all applications. Consistent design, everywhere.

Ts

Shared TypeScript Types

One source of truth for types. Fewer bugs, better developer experience.

Shared Configurations

ESLint, Prettier, TSCONFIG and more. One config to rule them all.

Shared Authentication

Reuse auth logic, guards and middlewares across all applications.

Shared Database Layer

Common models, migrations and utilities. Stay consistent.

Consistent Tooling

Same scripts, same standards, same quality across the codebase.

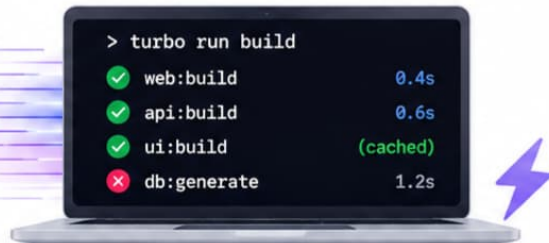

Share once. **Use everywhere.**
Move faster. **Stay consistent.**

TURBOREPO'S SECRET WEAPON

Build smarter, not harder.

Turborepo understands your codebase, its dependencies and runs tasks the **fastest way** possible.

Task Orchestration

Define tasks once and run them across packages and apps.

Dependency-Aware

Understands relationships between packages and apps.

Caching

Caches results locally and remotely. No need to rebuild unchanged tasks.

Parallel Execution

Runs independent tasks in parallel to save time.

Only What Changed

Rebuild only what's affected by your changes. Nothing more.

1. CODE CHANGE

You make a change in your code.

2. DEPENDENCY GRAPH

Turborepo analyzes the graph and finds affected tasks.

web:build	✓	(cached)
ui:build	✓	(cached)
api:build	✗	(rebuild)
db:generate	✓	(cached)

3. SMART EXECUTION

Runs only affected tasks. Uses cache for the rest.

4. FASTER BUILDS

Save time. Ship faster. Repeat.

Result:

Faster feedback loops, happier developers, better productivity.

100

WHEN SHOULD YOU USE TURBOREPO?

Monorepo $\neq$ always better.

Turborepo shines when you have multiple apps that grow together and share a lot.

Use it when it brings more value than complexity.

Start simple.

Move to a **monorepo** when your architecture actually needs it.

You have multiple applications

Web apps, admin panels, APIs, docs sites, mobile apps, etc.

Apps share significant code

UI components, types, configs, database models, auth, and more.

You need consistent tooling

ESLint, Prettier, TypeScript, testing, CI/CD – same setup across the board.

The project is expected to grow

A monorepo scales with your team and codebase, without creating silos.

You want better collaboration

Easier code reuse, atomic changes, and a better developer experience.

Build once.

Share everywhere.

Ship faster.

That's Turborepo.
