

Internship Daily Documentation

Day 1 — Monday, April 27, 2026

Smart Internship & Hiring Portal | Intern: Mageswaran G

Field	Details
Date	Monday, April 27, 2026
Intern	Mageswaran G
Project	Smart Internship & Hiring Portal
Mentor	Sandiya
Module	Week 1 — Project Setup & Authentication
Day Goal	Understand the project, set up full development environment, push first commit to GitHub
Time Started	3:46 PM
Time Finished	~8:30 PM
Total Time	~5 hours

1. SOD (Start of Day)

No formal SOD sent on Day 1 — Joined internship today.

An acknowledgement mail was sent to Sandiya instead.

Acknowledgement Mail Subject: Acknowledgement of Project Assignment

Dear Sandiya, Thank you for the detailed project assignment. I have thoroughly reviewed the document including core features, tech stack, module breakdown, and 6-week timeline. I will share SOD every morning and EOD every evening with task status. I will also share weekly progress updates every Friday. Thank you for this opportunity. Warm regards, Mageswaran G

Meeting Instructions Noted:

- Every Friday — Weekly progress meeting with Sandiya
- Every morning — Send SOD (Start of Day) update with planned tasks
- Every evening — Send EOD (End of Day) update with completed/pending status

2. Project Understanding

Project Name: Smart Internship & Hiring Portal (Mini LinkedIn + Internshala)

User Type	What They Can Do
Candidate	Register, upload resume, apply for jobs, track application status

Company	Register, post jobs, view applicants, shortlist candidates
Admin	Manage users, approve job posts, view analytics and dashboard

6-Week Module Plan

Week	Module
Week 1	Project Setup + Authentication
Week 2	User Profile Management
Week 3	Job/Internship Posting
Week 4	Application System
Week 5	Admin Dashboard
Week 6	AI Features

Final Tech Stack Decided

Layer	Technology	Reason
Frontend	React.js + Tailwind CSS	Component-based UI, fast development
Backend	Node.js + Express	JavaScript on server, same language as frontend
Database	MongoDB	Flexible, no rigid schema, beginner-friendly
Auth	JWT	Digital ID card, free, open source
File Upload	Multer	Free alternative to Cloudinary
Charts	Chart.js	Dashboard analytics visualization

3. Tools Installed Today

#	Tool	Version	Why Installed
1	Homebrew	5.1.8	Mac package manager — like a supermarket for developer tools
2	NVM	latest	Node Version Manager — switch between Node versions safely
3	Node.js	v20.20.2 (LTS)	JavaScript runtime — runs backend code
4	npm	10.8.2	Package manager — installs libraries
5	Git	2.54.0	Version control — save history of all code changes
6	MySQL	9.6.0	Installed but NOT used — decided MongoDB is better for this project
7	MongoDB	8.2.1	Database — stores data as flexible JSON-like documents
8	VS Code	1.115.0 (arm64)	Code editor — Apple Silicon version for Mac M4
9	nodemon	3.1.14	Auto-restarts server when code is saved

VS Code Extensions Installed

Extension	Publisher	Purpose
ES7+ React/Redux/React-Native snippets	dsznajder	Faster React coding with shortcuts
Thunder Client	Ranga Vadhineni	Test APIs directly in VS Code without Postman
Prettier - Code formatter	Prettier	Auto-formats code to look clean and consistent

Final Verification

Tool	Version	Status
node	v20.20.2	Verified
npm	10.8.2	Verified
git	2.54.0	Verified
mysql	9.6.0	Verified
mongod	8.2.1	Verified
code	1.115.0	Verified

4. GitHub Setup

Steps Completed:

```
git config --global user.name 'Mageswaran-G'
git config --global user.email 'mageswaran.g@outlook.com'
mkdir smart-hiring-portal && cd smart-hiring-portal
git init
git remote add origin https://github.com/Mageswaran-G/smart-hiring-portal.git
echo '# Smart Hiring Portal' >> README.md
git add . && git commit -m 'Day 1: Project setup and initial commit'
git branch -m master main
git push -u origin main
```

GitHub Repository: <https://github.com/Mageswaran-G/smart-hiring-portal>

5. Mistakes Made & How Fixed

#	Mistake	Root Cause	Fix Applied
1	Node v25.9.0 installed — too new and unstable	Used brew install node directly (installs latest)	Uninstalled, installed NVM, then Node v20 LTS via nvm install 20
2	git push failed: src refspec main does not match	Branch named master locally, GitHub expects main	Ran: git branch -m master main to rename branch

3	node_modules pushed to GitHub (1900+ files)	Created .gitignore AFTER first commit	Created .gitignore, ran: git rm -r --cached backend/node_modules
---	---	---------------------------------------	--

6. Key Concepts Learned Today

What is JWT?

- Digital ID Card created after login
- Stored in browser, sent with every request to backend
- Server verifies it without remembering users (stateless)
- Auto-expires for security
- 3 roles stored inside: candidate / company / admin

What is Homebrew?

- Package manager for Mac
- Like a Kirana shop — one command installs any tool
- Alternative to downloading installers manually

const vs let vs var

Keyword	Meaning	Example
const	Fixed value — cannot change (like Aadhaar number)	const PORT = 8000
let	Can change (like phone number)	let count = 0; count = 1;
var	Old way — avoid using in modern JavaScript	var x = 5; (avoid)

What is localhost / 127.0.0.1?

- Your own computer — not internet, not cloud
- localhost = 127.0.0.1 — same thing, different name
- 127.0.0.1 is safer on Mac M4 — avoids IPv6 issues

7. EOD (End of Day) Summary

Task	Status
Read and understand project document	Done
Send acknowledgement mail to Sandiya	Done
Install all development tools	Done
Configure GitHub account	Done
Create project repository	Done
Push first commit	Done

8. Important Notes for Future Reference

- Always create .gitignore BEFORE first commit — never push .env or node_modules
- Always use NVM to manage Node.js versions — never brew install node directly
- const = fixed variable, let = changeable variable, var = avoid
- Backtick is needed for template literals: Hello \${name}
- Mac Port 5000 can conflict with AirPlay — always use port 8000
- 127.0.0.1 is safer than localhost on Mac M4 (avoids IPv6 issues)
- SOD and EOD updates are non-negotiable — send every single day
- node_modules must ALWAYS be in .gitignore — never push it

9. Tomorrow's Plan — Day 2

- Set up backend project with Node.js and Express
- Connect MongoDB database
- Create User model (schema)
- Implement Signup API with bcrypt password hashing
- Test API using Thunder Client
- Push to GitHub and send SOD + EOD
